

SI 206 Discussion 3

Classes, Git

SI 206 00x FA 2021 > Modules > Discussion 3 - Assignment

Today

1. Object oriented programing
 - a. Create a Dice Class and Methods to roll the Dice, Store the value, etc.
 - b. Create Dice instances, and call the methods
2. Git : Commit code after each method and push to GitHub in the end

Basic Terminal / Command Prompt Commands

Will make your life easier....

1. **up arrow**: Bash history search
2. **Tab**: Autocomplete the filename. Super helpful with long filenames!

(quick demo)

Delete Pass!!

```
# import turtle module
from turtle import *

def draw_rectangle(turtle, xpos, ypos, width, height, color):
    """
    Write a function to draw a rectangle on the screen
    with the specified parameters.
    """
    pass

def draw_triangle(turtle, xpos, ypos, length, color):
    """
    Write a function to draw a triangle on the screen
    with the specified parameters.
    """
    pass
```

Once you write something in a function / class,
don't forget to delete "pass"

Git

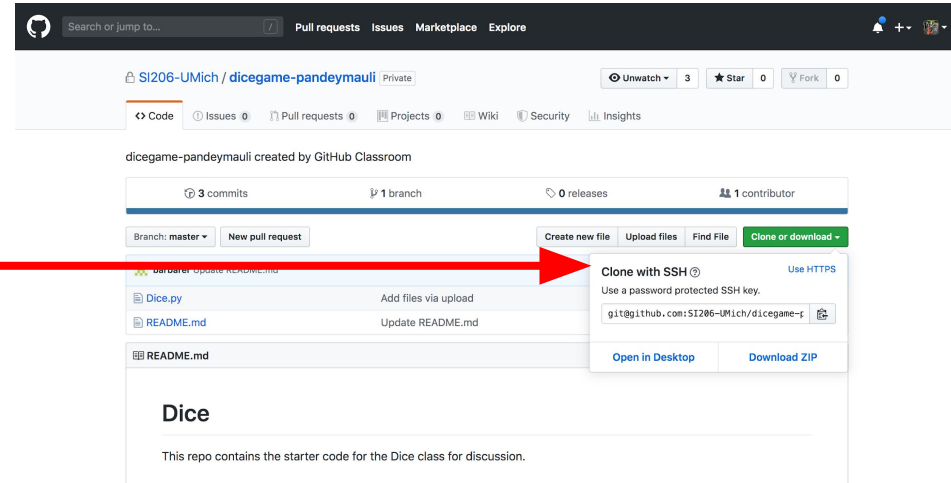

Starter code is here : See Modules > Discussion3 - Assignment

You may have to join the github classroom for SI206. Please do so.

Clone the discussion 3 repository using this command:

```
git clone <repository_url>
```

Copy repository_url from here

Problems 1 and 2 (Instructions also in starter code)

A dice is an example of an object we can simulate with a Python class. Actually, die is singular and dice is plural, but we will just call one die a dice in this assignment. Our *Dice* class will have a constructor (`__init__` method) along with additional methods to track our rolls and get data on them. For this exercise, you will be making a *Dice* class with the following:

- **Constructor (`__init__`) method:** the constructor will initialize a new dice object that has not yet been rolled. When you create the *Dice* object you will set how many sides the dice has. By default, it will have 6 sides. In the constructor, initialize instance variables for:
 - The number of sides
 - A list keeping track of all of the rolls. For example, `Last roll: 6` is rolled
- **`__str__` method:** create a string method so that printing an instance of the dice class outputs the value of the last roll. For example:

Problems 3 (Instructions also in starter code)

- **roll** method: Rolls the dice to get a random integer between 1 and the number of sides (hint: use the random module and include both 1 and the number of sides). Save the value at the end of a list that tracks all the values rolled. Returns the number rolled. For example :

```
Three sides dice
3
1
1
1
2
Last roll: 2

Six sides dice
4
2
2
4
3
Last roll: 3
```

Problems 4 (Instructions also in starter code)

- ***num_rolls*** method: Takes in user input to quantify the amount of rolls. It asks the users, “How many times do you want to roll?” It then prints out each roll. (hint: use the `input` function to handle user input). For example :

```
How many times do you want to roll? 10
6
2
5
2
3
1
5
2
3
1
```

Bonus Method (Instructions also in starter code)

print_count_for_num method: Takes in a parameter num which specifies which roll value to look for. Loop through the roll history list and count how many times that num was rolled. Print the number of times that value was rolled, for example :

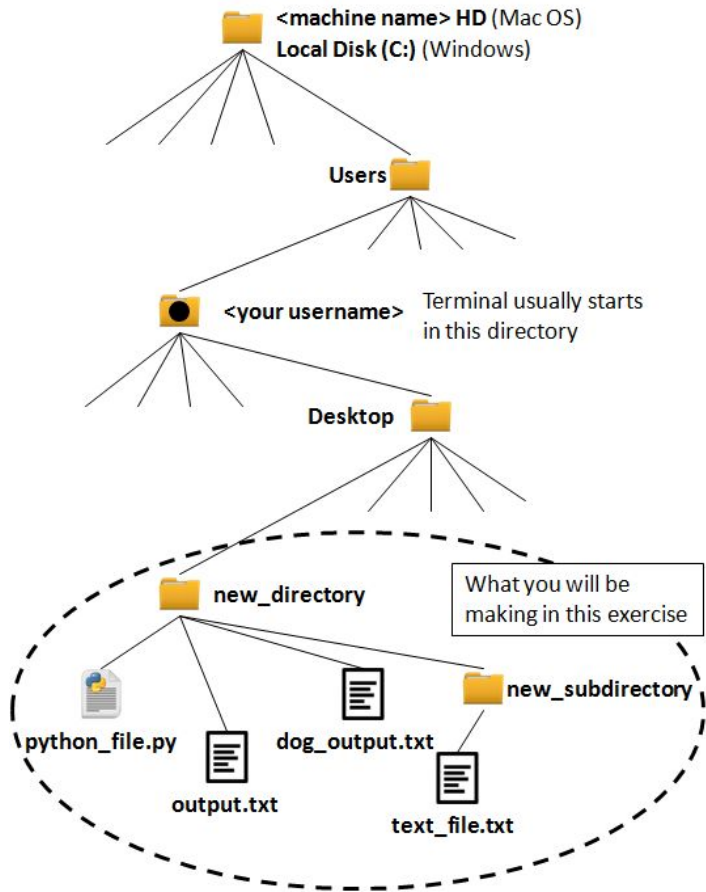

```
2 was rolled 4 times
```

Appendix

References for today

Review: Absolute path and relative path

Structure of your file system (when you complete this exercise)

1. Absolute path

Path from root directory

```
/Users/[Username]/Desktop/new_directory/  
output.txt
```

Path from home directory

```
~/Desktop/new_directory/output.txt
```

1. Relative path

If you are in "new_directory"

```
output.txt
```

If you are in "Desktop"

```
new_directory/output.txt
```

If you are in "new_subdirectory"

```
../output.txt
```

W10. Class and Instance

```
class vehicle():  
    body color  
    tire  
    type  
    owner
```

Class

A = vehicle(...):
body color: Red
tire: 4
type: Sedan
owner: Mary

B = vehicle(...)
body color: Blue
tire: 2
type: bicycle
owner: Tom

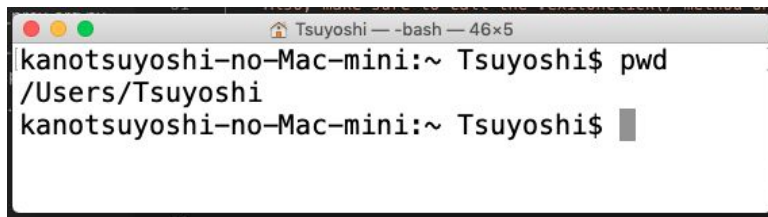

C = vehicle(...)
body color: Green
tire: 2
type: Scooter
owner: John

Instance

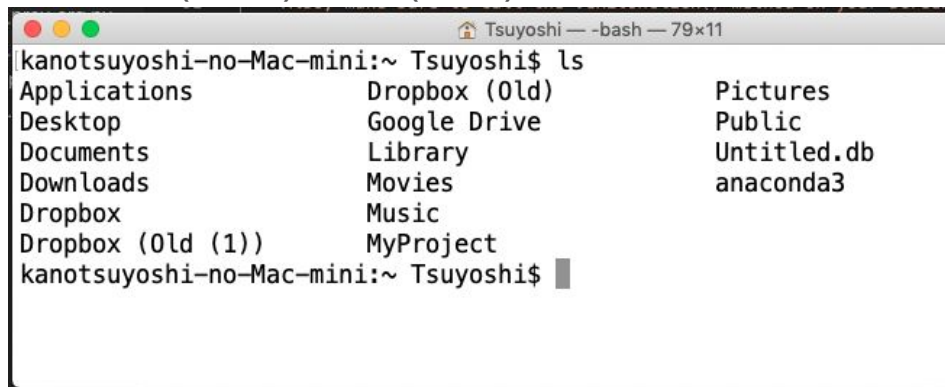

Appendix: Basic Linux / MS-DOS commands 1

1. **pwd** (Mac) / **chdir** (Win) : Display your location in the file system

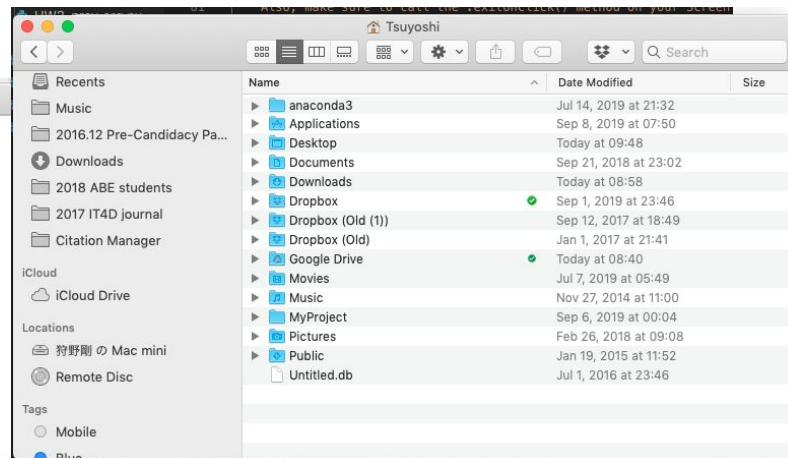

```
Tsuyoshi — -bash — 46x5
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$ pwd
/Users/Tsuyoshi
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$
```

1. **ls** (Mac) / **dir** (Win) : Lists files

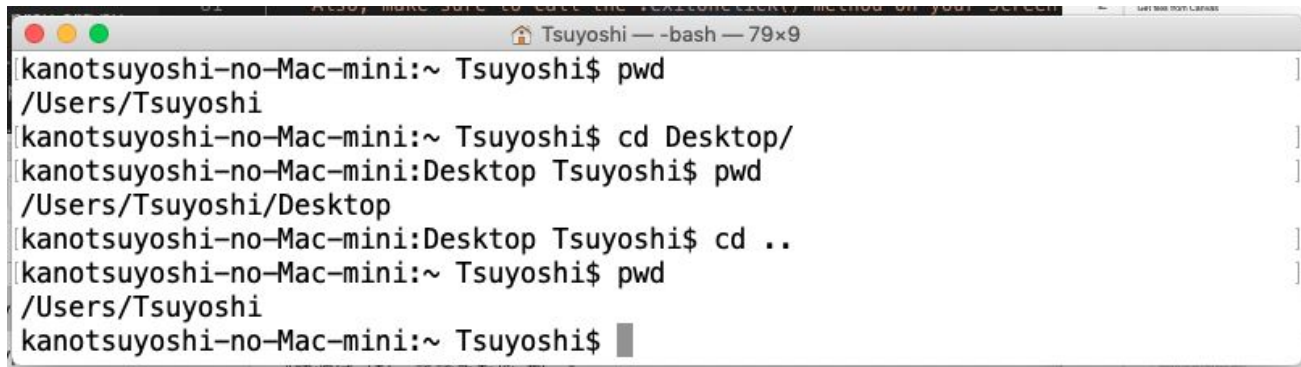

```
Tsuyoshi — -bash — 79x11
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$ ls
Applications      Dropbox (Old)      Pictures
Desktop           Google Drive       Public
Documents         Library            Untitled.db
Downloads         Movies             anaconda3
Dropbox           Music
Dropbox (Old (1)) MyProject
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$
```

Appendix: Basic Linux / MS-DOS commands 2

1. **cd** *pathname*: Changes directories

A screenshot of a terminal window titled "Tsuyoshi — -bash — 79x9". The terminal shows a series of commands and their outputs for navigating the file system. The user starts in the home directory (~), runs 'pwd' to see '/Users/Tsuyoshi', then 'cd Desktop/' to move to the Desktop directory, runs 'pwd' to see '/Users/Tsuyoshi/Desktop', then 'cd ..' to move back to the home directory, and finally runs 'pwd' to confirm they are back at '/Users/Tsuyoshi'.

```
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$ pwd
/Users/Tsuyoshi
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$ cd Desktop/
kanotsuyoshi-no-Mac-mini:Desktop Tsuyoshi$ pwd
/Users/Tsuyoshi/Desktop
kanotsuyoshi-no-Mac-mini:Desktop Tsuyoshi$ cd ..
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$ pwd
/Users/Tsuyoshi
kanotsuyoshi-no-Mac-mini:~ Tsuyoshi$
```

1. **python** *filename.py* / **python3** *filename.py* : Run a python file

Command's Purpose	MS-DOS	Linux	Basic Linux Example
Copies files	<code>copy</code>	<code>cp</code>	<code>cp thisfile.txt /home/thisdirectory</code>
Moves files	<code>move</code>	<code>mv</code>	<code>mv thisfile.txt /home/thisdirectory</code>
Lists files	<code>dir</code>	<code>ls</code>	<code>ls</code>
Clears screen	<code>cls</code>	<code>clear</code>	<code>clear</code>
Closes shell prompt	<code>exit</code>	<code>exit</code>	<code>exit</code>
Displays or sets date	<code>date</code>	<code>date</code>	<code>date</code>
Deletes files	<code>del</code>	<code>rm</code>	<code>rm thisfile.txt</code>
"Echoes" output to the screen	<code>echo</code>	<code>echo</code>	<code>echo this message</code>
Edits text files	<code>edit</code>	<code>gedit([a])</code>	<code>gedit thisfile.txt</code>
Compares the contents of files	<code>fc</code>	<code>diff</code>	<code>diff file1 file2</code>
Finds a string of text in a file	<code>find</code>	<code>grep</code>	<code>grep word or phrase thisfile.txt</code>

Command's Purpose	MS-DOS	Linux	Basic Linux Example
Formats a diskette	<code>format a:</code> (if diskette is in A:)	<code>mke2fs</code>	<code>/sbin/mke2fs /dev/fd0</code> (/dev/fd0 is the Linux equivalent of A:)
Displays command help	<code>command /?</code>	<code>man</code> or <code>info</code>	<code>man command</code>
Creates a directory	<code>mkdir</code>	<code>mkdir</code>	<code>mkdir directory</code>
Views contents of a file	<code>more</code>	<code>less</code> ([b])	<code>less thisfile.txt</code>
Renames a file	<code>ren</code>	<code>mv</code> ([c])	<code>mv thisfile.txt thatfile.txt</code>
Displays your location in the file system	<code>chdir</code>	<code>pwd</code>	<code>pwd</code>
Changes directories with a specified path (<i>absolute path</i>)	<code>cd pathname</code>	<code>cd pathname</code>	<code>cd /directory/directory</code>
Changes directories with a <i>relative path</i>	<code>cd..</code>	<code>cd ..</code>	<code>cd ..</code>
Displays the time	<code>time</code>	<code>date</code>	<code>date</code>
Shows amount of RAM in use	<code>mem</code>	<code>free</code>	<code>free</code>
